C1
C2
C3
C4
MACE-MP-0: 51 converged relaxations
Zhao et al., Lu et al.: sintered SiGe with C
DFT phonon BTE: 9 compositions, 5 temperatures
Starrydata2: sintered $Si_{0.8}Ge_{0.2}$ records
SiC scattering model (contrast bracket)
C1: carbon ends as SiC in Si-rich pockets
C2: sintered SiGe acts as 0.1 to 0.9 µm grains
C3: SiC with R ≥ 10 nm lowers κ_L by at most 11% per at% C; the drop reported by Zhao et al. is not from SiC (C3 does not depend on the bracket)
C4: few-nm SiC lowers κ_L by 13 to 27% per at% C (depends on the bracket)
Revising the bracket changes C4 and the size of the Ge saving; C1 to C3 stand
Ge saving (C3, C4), pre-check: 27 to 51% less Ge at equal κ_L
